

Bluefors Digital Playbook

Before applying, I studied Bluefors' homepage the way I would in my first week in the role: what it does well, where it leaks demand, and what I would publish this quarter. This page holds the audit, a measurement framework, a Q4 2026 content calendar and six social posts ready for review.

Prepared by **Kira Krysanov** Snapshot of **bluefors.com** on **1 Oct 2026** Independent sample, not commissioned by Bluefors

The sections follow the plates of a dilution refrigerator, from room temperature down to the mixing chamber. Each step goes from diagnosis toward execution.

50 K

Homepage audit

FIRST STAGE · REMOVE THE BIGGEST HEAT LOADS

The homepage already looks like a market leader. The opportunities are in conversion paths, consistency and making the site easier for search engines and AI answer engines to understand. Findings are ranked by expected commercial impact.

Keep and build on

Ownable visuals
Gold-plated cryostat photography and "Cool For Progress" are instantly recognisable.

Named proof
Testimonials carry real names and institutions: The University of Chicago, Silicon Quantum Computing.

Fresh news
Three stories in September alone, plus a "Latest" ticker in the hero.

Customer logo wall
Aalto, AIST, Alice & Bob, D-Wave, Fujitsu, IQM, Jülich and more.

HIGH

Two different headline numbers for installed systems

EVIDENCE

Homepage: *"over 1 500 systems installed and fully-operational"*.
Bluefors' LinkedIn company page: *"more than 1,800 systems delivered"*.

WHY IT MATTERS

This is the company's main proof point. AI answer engines and journalists quote whichever number they find first, so two figures weaken both.

FIX

Agree one figure and one definition (delivered vs operational). Store it in a single place and update the site, LinkedIn, press boilerplate and sales decks together.

HIGH Only one call to action, and it asks for a sales conversation

EVIDENCE

The hero offers only *"Contact Sales"*. The newsletter appears only as a footer link. Product cards end in *"Read more"*.

WHY IT MATTERS

A physicist scoping a lab or a QPU team planning a roadmap is months from buying. With no mid-funnel offer, these visitors leave anonymous and never reach Salesforce.

FIX

Add tiered offers: "Talk to an application scientist", gated spec sheets or system sizing guides, webinar registration and a newsletter signup in the page body. Score each one in Salesforce.

HIGH The H1 never says what Bluefors makes

EVIDENCE

H1: *"Delivering the Quantum Future, Today"*. The words "dilution refrigerator" and "cryogenic" don't appear above the fold.

WHY IT MATTERS

Search engines and LLMs weight headings heavily when deciding what an entity is. The category Bluefors leads is missing from its most important heading.

FIX

Keep the brand line and add a category subhead, for example "Dilution refrigerators and cryogenic infrastructure for quantum computing". A/B test the version with the category name.

MEDIUM Four carousels hide most of the content

EVIDENCE

Customer logos (3 slides), products (3 visible), testimonials (2 visible) and news all sit behind arrows.

WHY IT MATTERS

Few visitors click past the first slide, so most logos and products go unseen. Content loaded inside sliders can also be harder for crawlers to read.

FIX

Replace the product slider with a static category grid that matches the menu: dilution refrigerators, 1K/4K systems, measurement infrastructure, cryocoolers, helium management. Check scroll depth and click data in analytics first.

MEDIUM Homepage speaks only to quantum computing

EVIDENCE

The Applications menu lists Low Temperature Physics, Medical and Life Sciences and Clean Energy. None of them appear on the homepage.

WHY IT MATTERS

Visitors from adjacent markets can't see themselves on the page. The site also misses a chance to segment visitors by need.

FIX

Add an "I'm working on..." chooser (QPU development, physics research, sensing, life sciences). Each path sets a field in the CRM and starts the matching nurture track.

MEDIUM Strong expertise, not yet packaged for AI answer engines

EVIDENCE

The September research article on wiring density and the customer stories hold real expertise. The homepage has no FAQ or explainer content to support them.

WHY IT MATTERS

Buyers now ask ChatGPT, Perplexity and Google AI Overviews things like "best dilution refrigerator for superconducting qubits". Those tools cite pages that answer in plain, structured language.

FIX

Build a "Cryogenics explained" hub with short Q&A pages, FAQ and Product schema, specs as HTML rather than PDF, and an llms.txt file. Track AI citations monthly against a fixed set of prompts.

MEDIUM

Event block doesn't ask for a meeting

EVIDENCE

"NYC Quantum Summit 2026, October 05 – October 06" is listed with a skyline photo and no registration or booking link.

WHY IT MATTERS

Pre-booked meetings are where event ROI comes from. Without a booking link, the site can't feed the booth calendar.

FIX

Add "Book a meeting with our team" on every upcoming event card, routed into a Salesforce campaign with a 48-hour follow-up rule.

LOW

Vague link text, truncated titles and thin body type

EVIDENCE

Repeated "Read more" links. Story links cut off mid-word: "Building the Foundations of the Quant...". Body copy is set in a light grey, thin weight.

WHY IT MATTERS

Descriptive links help screen readers (WCAG 2.4.4) and give search engines anchor text. Low-contrast body text is hard to read on laptops in bright labs.

FIX

Use descriptive link text ("Read the XLDsl system specs"), let titles wrap to two lines, and check body text against WCAG AA contrast.

Scope: this audit is based on a full-page capture of the public homepage. I'd verify page speed, structured data, analytics tagging and CRM form routing with the team in week one. The figures quoted come from Bluefors' own homepage and LinkedIn page.

Measurement framework

PULSE-TUBE STAGE · STABLE BASELINES BEFORE GOING COLDER

One KPI tree from first visit to pipeline, so every channel report answers the same question: **did this move a qualified buyer closer to a conversation with Sales?** Targets are set after a four-week baseline, not guessed upfront.

FUNNEL STAGE	PRIMARY KPI	SUPPORTING SIGNALS	SOURCE
Discover	Non-branded organic sessions to product and application pages	Rankings for category terms, AI-answer citations across 20 tracked prompts, LinkedIn impressions among target accounts	GA4, Search Console, GEO tracker, LinkedIn
Engage	Engaged sessions per visit to product pages	Scroll depth, spec views, webinar attendance, newsletter growth	GA4, webinar platform, marketing automation
Convert	Marketing-qualified leads by offer tier	Form conversion rate per CTA, meetings booked per event	Marketing automation, Salesforce
Accept	MQL → SQL conversion rate	Sales acceptance time, rejection reasons, data completeness	Salesforce
Revenue	Marketing-sourced and influenced pipeline (€)	Pipeline per campaign, deal velocity in target accounts	Salesforce campaign influence

Benchmark set for share of voice: Oxford Instruments NanoScience, Maybell Quantum, ICEoxford and Zero Point Cryogenics. A monthly one-page report goes to Sales leadership: three numbers, one insight and one decision.

Q4 2026 content calendar

STILL · STEADY CIRCULATION

Thirteen weeks built around events and stories Bluefors has already published, organised into five content pillars. Every week has one flagship piece and a channel plan. Filter by pillar to check the balance.

● **Proof** customer outcomes
● **Physics** education & research
● **Partners & news** ecosystem moments

● **People** makers & careers
● **Product & applications** what we build

Dates to confirm internally: Bluefors' presence at Q2B Chicago (8-10 Dec 2026) and spokesperson availability. Placeholders are marked in the drafts below.

Six LinkedIn posts from the calendar, written in Bluefors' voice: confident, warm and grounded in physics. Highlighted text marks facts I'd confirm with the team before publishing.

● PHYSICS

W42 · Carousel, 6 slides

Post 1 · Wiring density

Every qubit needs wires. Every wire carries heat. At the coldest stage of a quantum computer, the heat budget is tiny.

So how many qubits can one cryostat actually wire?

Our researchers set out to derive the limits of quantum computer wiring density. Swipe through for the short version 👉

- 1 · Why every control line is a heat leak
- 2 · The cooling budget at the mixing chamber
- 3 · Where today's wiring approaches hit the ceiling
- 4 · [Key finding from the 9 Sep paper]
- 5 · What it means for utility-scale roadmaps

Full article in the comments.

● PROOF

W43 · Quote card + photo

Post 2 · Year-long experiment

One experiment. Running for about a year.

"Once the fridge is cold, our experiment times vary from few weeks to few months. I think the longest running experiment we had was about one year."

— Tian Zhong, Assistant Professor, The University of Chicago

For a research group, uptime means results. That's what our systems are built for.

● PARTNERS & NEWS

W44 · 60–90 s video

Post 4 · Xanadu partnership

Utility-scale quantum computing needs utility-scale cooling.

Last month, Xanadu and Bluefors announced a partnership to redefine cryogenic infrastructure for utility-scale quantum computing.

We asked [Bluefors engineer] and [Xanadu engineer] one question: what has to change when you go from lab scale to data-center scale?

Their answer in 90 seconds 🎥

#CoolForProgress #QuantumComputing @Xanadu

Visual: Two-person interview, split screen, captions burned in

Post 5 · Meet the makers

Meet the makers, episode 1 

[Name] has built [number] dilution refrigerators in our Helsinki factory.

"[One sentence on the most satisfying moment in the build]"

Every system that cools a quantum processor starts with hands like these.

We're hiring in Helsinki and beyond. Open positions in the comments.

#CoolForProgress #LifeAtBluefors #Helsinki

Visual: Workshop portrait, gold plates in the foreground

CTA: Open positions page

354 characters

Post 6 · Colder than space

Deep space: about 2.7 kelvin.

Inside a Bluefors dilution refrigerator: millikelvin. That's colder than space, and close to absolute zero.

Why go that far? Superconducting qubits are so sensitive that heat itself is noise. Cool them down and quantum states can survive long enough to compute.

Here's the journey, plate by plate, in 60 seconds 

#CoolForProgress #Physics #QuantumComputing

Visual: Vertical camera move down a cryostat with a temperature counter per plate

CTA: "Cryogenics explained" hub

DAYS 1–30 · LISTEN

Map the ecosystem

- Meet Sales, Product Marketing and IT, and shadow two customer calls
- Audit Salesforce: lead sources, campaign structure, data quality
- Set the KPI baseline and the first monthly report
- Fix quick wins: the systems number, event booking links, link text

DAYS 31–60 · FIX

Build the conversion layer

- Launch tiered CTAs and lead scoring with Sales sign-off
- Event playbook: pre-booking, badge-scan routing, 48-hour follow-up
- Brief the agency on the homepage test for the H1 and product grid
- Publish the first five "Cryogenics explained" pages

DAYS 61–90 · SCALE

Prove pipeline impact

- ABM pilot with Sales on 20 named accounts
- Nurture tracks by application segment
- GEO tracker live, with a quarterly AI-visibility report
- Q1 2027 plan built from Q4 results
